A New Species of Pseudocloeon from Idaho¹

(Ephemeroptera: Baetidae)

STEVEN L. JENSEN
University of Utah, Salt Lake City

While studying the mayflies of Idaho, I found two male imagos that represent an undescribed species of *Pseudocloeon*. I take extreme pleasure in naming this species for Dr. George F. Edmunds, Jr., in recognition for his many contributions to the study of Ephemeroptera. I express my appreciation to Mr. Arwin Provonsha for aid in preparing the illustrations.

Pseudocloeon edmundsi Jensen, new species

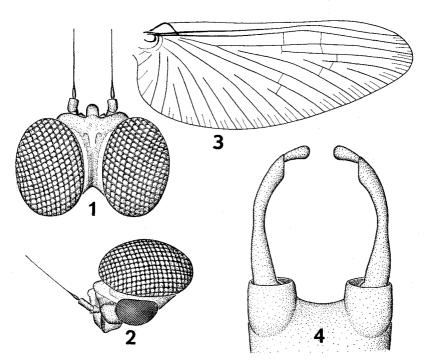

Male Imago (in alcohol).—Length: body 4.5–5.0 mm; forewings 4.5–5.0 mm. General color light brown. Head light brown; antennae light brown basally, pale apically; ocelli white; compound eyes divided, upper portion turbinate, separated dorsally at midline, pinkish-tan, lower portion black (figs. 1–2). Thoracic notum reddish-brown; pleural sclerites light reddish-brown, membranes white; thoracic sterna light reddish-brown. Forewings hyaline, stigmatic region cloudy white, longitudinal and crossveins hyaline, stigmatic crossveins slightly anastomosed (fig. 3); hind wing absent. Legs white, faintly brown at apex of tarsi. Abdominal tergum 1 subhyaline light brown; terga 2–6 subhyaline white with very faint black spiracular markings; terga 7–10 light tan, opaque. Abdominal sterna 1–6 same color as terga; sterna 7–9 white, opaque; subgenital plate and forceps white (fig. 4). Caudal filaments white.

Types.—Holotype male imago, Snake River at U. S. Highway #20-26, 8 miles NW. Parma, Canyon County, Idaho, 29 August 1958, G. F. Edmunds, Jr., and R. K. Allen, in collection of University of Utah, Salt Lake City. Paratopotype: 1 male imago, same data and deposition as holotype.

REMARKS.—Pseudocloeon edmundsi is the fourth species in the genus known from western North America. The other three species, P. futile McDunnough, P. rubrolaterale McDunnough, and P. turbidum McDun-
