(昭和四十年九月二十二日発表)

大正十五年（昭和元）七月十七日 宇部市に新種の記録一新種のカゲロウ
The fruit is oval and elongated, with a smooth surface. It is usually dark red or purple when ripe. The fruit contains a single seed, which is encased in a hard, woody outer shell. The seeds are typically dispersed by wind or water, allowing the plants to reproduce in new locations. The nuts are harvested when fully ripe and are used in various culinary applications, such as baking, confectionery, and health supplements.
