Dodds's Types for Two Species of *Callibaetis* (Ephemeroptera)

By THOMAS B. THEW, Davenport Public Museum,
Davenport, Iowa

Two species of mayflies, *Callibaetis vitreus* and *Callibaetis fuscus*, were described by Dodds in 1923 (Trans. Amer. Ent. Soc. 49: 93-114) in the results of his studies on the fauna of Colorado. Unfortunately, not only were the original descriptions extremely terse, but also no designation of a type for one species was made. In the Biology of Mayflies (Ithaca, New York, 1935), Traver pointed out that *C. vitreus* Dodds was a primary homonym of *C. vitreus* Navas and so renamed the former species *C. doddsi*. She could not place either of Dodds's species correctly, however, for the necessary detailed descriptions were lacking. Through the kindness of Harold J. Grant, Jr., of the Academy of Natural Sciences of Philadelphia, the author has been allowed to examine Dodds's material of these two ephemerids. Consequently, I hereby designate the male (Acad. Nat. Sci. Phila. type no. 9026), of the syntypal series of one male, one female, and one nymph as the lectotype of *C. fuscus* Dodds. I have also examined the single type, a male (Acad. Nat. Sci. Phila. type no. 9027) of *C. vitreus* Dodds [= *C. doddsi* Traver]. A detailed description of each species will be given in a subsequent paper.
